ASTCO2 - LECTURE 1 - PROF. HANNO REIN COORDINATE SYSTEMS

## ASTC02 - LECTURE 1 - COORDINATE SYSTEMS

## 

- Need a way to specify the location of celestial objects
van be in 3D or in 2D
, Different coordinate systems exits for different purposes
- Spherical / cartesian, different origins, different orientation
- Can convert between them

## HORIZONTAL COORDINATE SYSTEM

- Local observer's horizon is the fundamental plane
- Altitude (alt) / Azimuth (az)
> Azimuth measured from north, increasing towards east
- Altitude from horizon upwards

## ASTC02 - LECTURE 1 - COORDINATE SYSTEMS

## HORIZONTAL COORDINATE SYSTEM

- Meridian is the line from North to the Zenith to South
- Azimuth 0 and 180

## HORIZONTAL COORDINAIE SYSTEM PROS

, Know exactly where to look

## HORIZONTAL COORDINATE SYSTEM CONS

> Depends on time and location

## EQUATORIAL COORDINATE SYSTEM

- Fundamental plane is the Earth's equator
- primary direction towards the vernal equinox
- Declination (dec) / Right Ascension (ra)

## EQUATORIAL COORDINATE SYSTEM PROS

- Fixed stars have fixed coordinates
, Coordinates do not depend on time or date

## EQUATORIAL COORDINATE SYSTEM CONS

> Harder to find objects

## ANGLES IN ASTRONOMY

- Both coordinate systems use angles
- Multiple way to specify angles:
- Degrees $0^{\circ}-360^{\circ}$
> Radians 0-2п
> Hours Oh-24h

## DEGREES

- 1 full circle $=360^{\circ}$
>1 degree $=60$ arc minute $=60^{\prime}$
- $1^{\prime}$
$=60$ arc seconds $=60^{\prime \prime}$
> $1^{\prime \prime}$
$=1000$ milli arc seconds $=1000 \mathrm{mas}$
〉 1 mas
$=1000$ micro arc seconds $=1000 \mu \mathrm{as}$

## Venus

Type: planet
Magnitude: -4.03 (extincted to: -3.76 )
Absclute Magnitude: 27.33
RA/Dec (J20C0.0): $5!128 \mathrm{~m} / 23.11 \mathrm{~s} /+21^{\circ} 20^{\prime} 31.4^{\prime}$
RA/Dec (|2017.6): 5 h $29 \mathrm{~m} 25.19 \mathrm{~s} /+21^{\circ} 21^{\prime} 18.9^{*}$
Hour angle/DE $19 \mathrm{~h} 21 \mathrm{~m} 41.41 \mathrm{~s}^{\prime}+21^{\circ} 22^{\prime} 26.5^{\prime \prime}$ (apparent)
Az!Alt: $+87^{\circ} 25^{\prime} 20.8^{\prime \prime} /+29^{\circ} 07^{\prime} 24.5^{\prime \prime}$ (apparent)
Ecliptic lonqituceflatitude ( 12000.0 ): $+82^{\circ} 38^{\prime} 14.4^{\prime \prime} /-1^{\circ} 53^{\prime} 43.7^{\prime \prime}$
Fcilntic longituce/latitude (J2017.6): $+82^{\circ} 52^{\prime} 57.5^{\prime \prime} /-1^{\circ} 53^{\prime} 35.5^{\prime \prime}$
Galactic longitudc/latitude: $-175^{\circ} 38^{\prime} 54.7^{\prime /} / 7^{\circ} 20^{\prime} 58.3^{\prime \prime}$
Otliquity (of date, for Earth): $+23^{\circ} 26^{\prime} 13.2^{\prime \prime}$
Distance: 1.101AU (164.6B1 Mio km)
Apparent ciameter: $+0^{\circ} 00^{\prime} 15.2^{\prime \prime}$
Sidereal period: 224.70 days ( 0.615 a)
Sidereal day: 5832h28m47.1s
Mean solar day: 2802 hCm52.25
Verus

Phasc Angle: $+63^{\circ} 45^{\prime} 25^{\prime \prime}$
Flongation: $+39^{\circ} 49^{\prime} 08^{\prime \prime}$
Phase: 0.72
Illuminated: 72.1\%

## Venus

Type: planet
Magnitude: -4.03 (extincted to: -3.76)
Absolute Magnitude: 27.33
RA/Dec (J2000.0): 5h28m23.11 / + $21^{\circ} 20^{\prime} 31.4^{\prime \prime}$
RA/Dec (J2017.6): 5h29m26.19s, . $=$ :
Hour angle/DE: $19 \mathrm{~h} 21 \mathrm{~m} 41.41 \mathrm{~s} /+21^{\circ} 22^{\prime} 26.5^{\prime \prime}$ (apparent)
Az/Alt: $+87^{\circ} 25^{\prime} 20.8^{\prime \prime} /+29^{\circ} 07^{\prime} 24.5^{\prime \prime}$ (apparent)
Ecliptic longitude/latitude (J2000.0): $+82^{\circ} 3^{\prime} 14.4^{\prime \prime} /-1^{\circ} 53^{\prime} 43.7^{\prime \prime}$
Ecliptic longitude/latitude (J2017.6): $+82^{\circ} 52^{\prime} 57.5^{\prime \prime} /-1^{\circ} 53^{\prime} 35.5^{\prime \prime}$
Galactic longitude/latitude: $-175^{\circ} 38^{\prime} 54.7^{\prime \prime} /-7^{\circ} 20^{\prime} 58.3^{\prime \prime}$
Obliquity (of date, for Earth): $+23^{\circ} 26^{\prime} 13.2^{\prime \prime}$
Distance: 1.101AU (164.681 Mio km)
Apparent diameter: $+0^{\circ} 00^{\prime} 15.2^{\prime \prime}$
Sidereal period: 224.70 days ( 0.615 a)
Sidereal day: 5832h28m47.1s
Mean solar day: 2802 h0m52.2s
Phase Angle: $+63^{\circ} 45^{\prime} 25^{\prime \prime}$
Elongation: $+39^{\circ} 49^{\prime} 08^{\prime \prime}$
Phase: 0.72
Illuminated: 72.1\%

## DEGREES, MEASURED BY HAND

## HOURS

, 1 full circle $=24 \mathrm{~h}$
, $1 \mathrm{~h}=60$ minutes $=60 \mathrm{~m}$
> 1 m
$=60$ seconds $=60 \mathrm{~s}$

## Venus

Type: planet
Magnitude: -4.03 (extincted to: -3.76)
Absolute Magnitude: 27.33

RA/Dec (J2017.6 : 5h29m26.195/ -21 ${ }^{\circ} 21^{\prime} 18.9^{\prime \prime}$
Hour angle/DE: 」ニ. =............ $21^{\circ} 22^{\prime 26.5 " ~(a p p a r e n t) ~}$
Az/Alt: $+87^{\circ} 25^{\prime} 20.8^{\prime \prime} /+29^{\circ} 07^{\prime} 24.5^{\prime \prime}$ (apparent)
Ecliptic longitude/latitude (J2000.0): $+82^{\circ} 3^{\prime} 14.4^{\prime \prime} /-1^{\circ} 53^{\prime} 43.7^{\prime \prime}$

Elongation: $+39^{\circ} 49^{\prime} 08^{\prime \prime}$
Phase: 0.72
Illuminated: 72.1\%

## CONVERSION BETWEEN COORDINATE SYSTEMS

, Not difficult, just two rotations
( Do not remember formula, but do look at it and try to understand it

- To go between RA/DEC and AZ/ALT one also needs
> Time
, Location
- How to specify time? Sidereal time

## SIDEREAL TIME

, Which star is on our local meridian?

- Depends on time and date
, Our normal clocks use solar time
- Astronomers are interested in sidereal time
- Local Sidereal Time (LST) is 0 hours when the vernal equinox $(R A=0)$ is on local meridian

## SIDEREAL TIME

- Hour angle HA = LST - RA
- Tells you where your object is with respect to the meridian.
- |HA|> 6 hours hard to observe (but depends on declination)

ASTCO2 - LECTURE 1 - PROF. HANNO REIN COORDINATE SYSTEMS

## EXAMPLE (WITHOUT THE CELESTIAL SPHERE)

At midnight on 1998 February 4th, LST at St. Andrews was 8h45m.

St. Andrews has longitude $2^{\circ} 48^{\prime} \mathrm{W}$.
What was the Local Hour Angle of Betelgeuse ( $R A=5 \mathrm{~h} 55 \mathrm{~m}$ ) at midnight?

At what time was Betelgeuse on the meridian at St.Andrews?

At what time was Betelgeuse on the meridian at Greenwich?

## EXAMPLE

At midnight on 1998 February 4th, LST at St. Andrews was 8h45m.

St. Andrews has longitude $2^{\circ} 48^{\prime} \mathrm{W}$.
What was the Local Hour Angle of
Betelgeuse ( $\mathrm{RA}=5 \mathrm{~h} 55 \mathrm{~m}$ ) at midnight?
At what time was Betelgeuse on the meridian at St.Andrews?

At what time was Betelgeuse on the meridian at Greenwich?

## SOLUTIONS

2h 50 m

21h 10 m

20h 59m

## PROBLEMS WITH THE ECUATORRIAL SYSTEM

, Equatorial coordinates change slowly
, Timescale 25770 years
v This is because Earth's rotation axis precesses around the orbital plane

- Must also specify Epoch, the standard nowadays is J2000

## ASTCO2 - LECTURE 1 - COORDINATE SYSTEMS

## GALACTIC COORDINATE SYSTEM

, Earth at centre

- Latitude and longitude
, 0 towards galactic centre
